

# Asteroid Shapes

1. With your group, come up with a way to measure the roundness of each object. In 2-3 sentences, describe the measurements you are using to determine the asteroid roundness. What roundness would a perfectly circular object have?
2. In the provided table, collect data on the roundness and mass of each asteroid
3. Plot the mass vs. roundness on the provided graph (Note: the masses are BIG so each tick mark on the x-axis of the graph represents a power of ten!)
4. In 2-3 sentences, describe any trends you see in the plot. What other factors besides mass might influence how round an asteroid is?

## Data Table

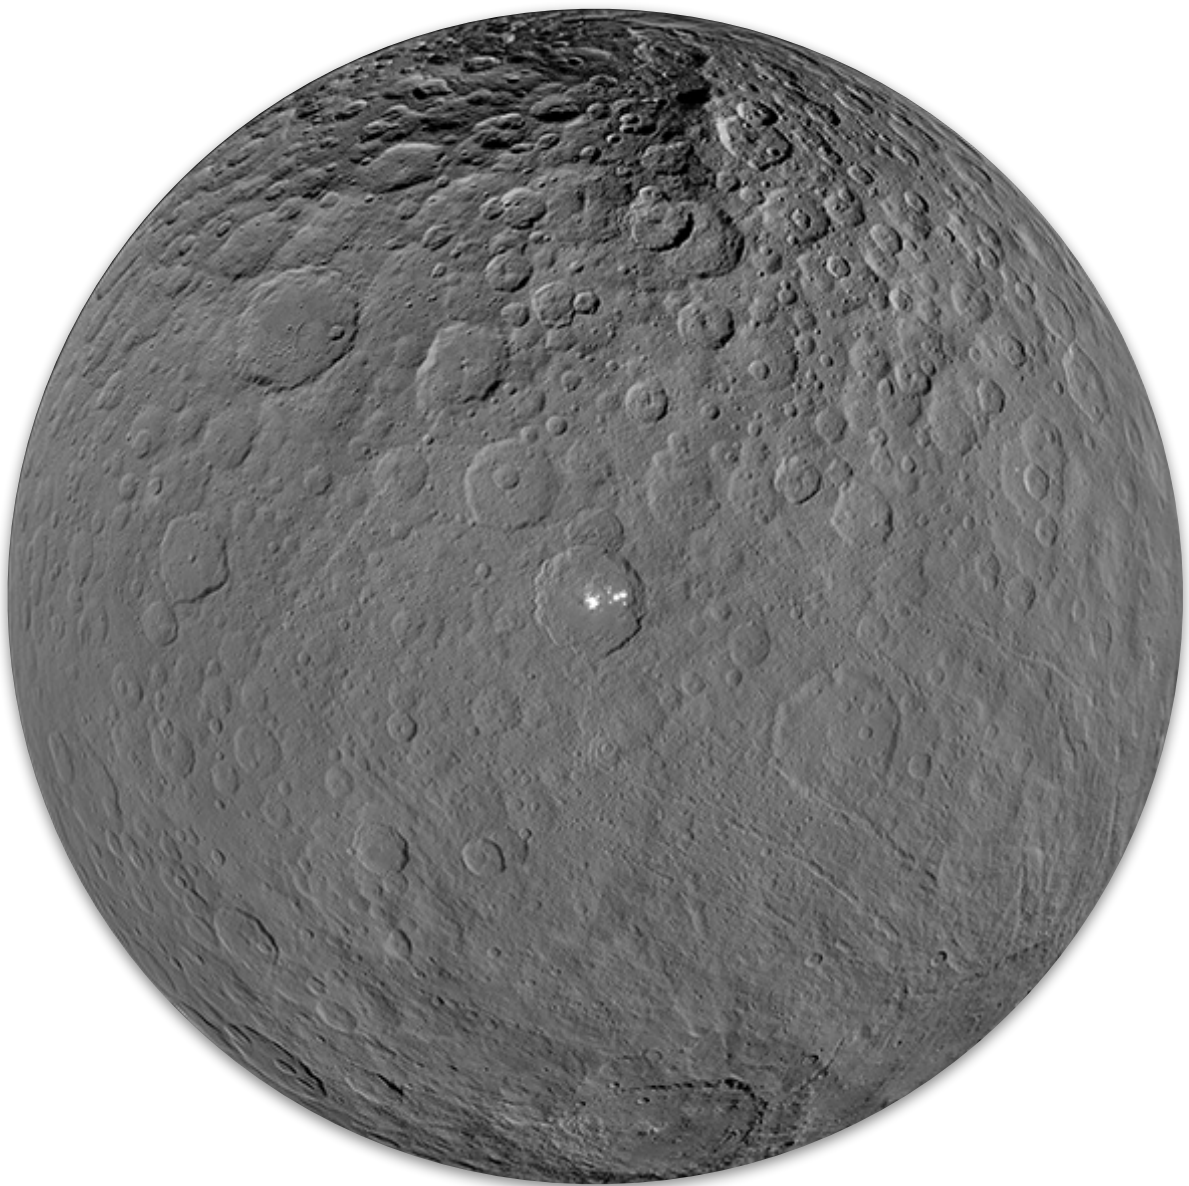

# Eros

<b>Distance from the sun</b>	1.5 AU
<b>Mass</b>	$7 \times 10^{15}$ kg
<b>Composition</b>	Stony / Silicate (2.7 g / cc)

# Ceres

<b>Distance from the sun</b>	2.8 AU
<b>Mass</b>	$9 \times 10^{20}$ kg
<b>Composition</b>	Rock/Ice (2.2 g/cc)

# Pallas

<b>Distance from the sun</b>	2.8 AU
<b>Mass</b>	$2 \times 10^{20}$ kg
<b>Composition</b>	Stony / Silicate (2.9 g / cc)

# Ida

<b>Distance from the sun</b>	2.9 AU
<b>Mass</b>	$4 \times 10^{16}$ kg
<b>Composition</b>	Stony / Silicate (2.6 g / cc)

# Sylvia

<b>Distance from the sun</b>	3.5 AU
<b>Mass</b>	$1.5 \times 10^{19}$ kg
<b>Composition</b>	Porous Rock/Ice (1.4 g/cc)

# Vesta

<b>Distance from the sun</b>	2.4 AU
<b>Mass</b>	$2.6 \times 10^{20}$ kg
<b>Composition</b>	Igneous Rock (3.4 g/cc)

# Daphne

<b>Distance from the sun</b>	2.8 AU
<b>Mass</b>	$7 \times 10^{18}$ kg
<b>Composition</b>	Carbonaceous Rock (1.9 g/cc)

# Lutetia

<b>Distance from the sun</b>	2.4 AU
<b>Mass</b>	$1.7 \times 10^{18}$ kg
<b>Composition</b>	Rocky / Metallic? (3.4 g / cc)

# Psyche

<b>Distance from the sun</b>	2.9 AU
<b>Mass</b>	$2 \times 10^{19}$ kg
<b>Composition</b>	Metallic (3.9 g/cc)

# Mathilde

<b>Distance from the sun</b>	2.6 AU
<b>Mass</b>	$1 \times 10^{17}$ kg
<b>Composition</b>	Carbonaceous/Porous (1.3 g/cc)
